CS 61A  
Spring 2017

Structure and Interpretation of Computer Programs

MOCK MIDTERM 1

---

INSTRUCTIONS

- You have 1 hour to complete the exam.
- The exam is closed book, closed notes, closed computer, closed calculator, except one 8.5" × 11" cheat sheet of your own creation.
- Mark your answers **on the exam itself**. We will *not* grade answers written on scratch paper.

## 1. (10 points) Send Help

```

b = 5
def x(x, help):
    def send(help):
        print(help)
        return nope
    def nope(send):
        print(send)
        return help
    a = send(help)
    def help():
        return x("help")

    print("More")
    return a

```

Expression	Interactive Output
print(print(print("hi")))	
print((lambda x: print("which")) (print("is")), "first")	
a = print("hi")	
b = a	
print(b)	
x = x(lambda x: print("oh dear"), print("which print"))	
x = x("almost")	
print(x())	

**2. (10 points) Stuk In Lambda's**

Fill in the environment diagram that results from executing the code below until the entire program is finished, an error occurs, or all frames are filled. *You may not need to use all of the spaces or frames.*

A complete answer will:

- Add all missing names and parent annotations to all frames.
- Add all missing values created or referenced during execution.
- Show the return value for each local frame.

```

1  x = lambda x: x
2  def f(g, h):
3      x = lambda: True
4      def y():
5          if f():
6              return 'a'
7          else:
8              return 'b'
9      f, x = x, lambda: False
10     return g(y)
11
12 f(lambda h: h(), x)
13
14
15
16
17

```

### 3. (10 points) Gib-me the Words!

Did you know that in Python, you can access elements in a string exactly like you access elements in a list? For example, if we were given the string, `Gibbes`:

- (a) Assigning to the variable `g`, allows us to access the 'G' with `g[0]`.
- (b) Slicing and concatenation are valid: `g[3:] + 't'` evaluates to 'best'.

Write a function that follows the specs below by creating a list of words out of a string, where a word has no spaces (' '). DO NOT USE LEN.

**You may only use the lines provided. You may not use any Python built-in sorting functions.**

```
def wordify(s):
    """ Takes a string s and divides it into a list of words.
    Assume that the last element of the string is a whitespace.
    Duplicate words allowed.
    >>> wordify( sum total of human knowledge )
    ['sum', 'total', 'of', 'human', 'knowledge']
    >>> wordify('one should never use exclamation points in writing! ')
    ['one', 'should', 'never', 'use', 'exclamation', 'points', 'in', 'writing!']
    """
    start, end, lst = _____

    for letter in _____:
        if letter != ' ':
            end = _____

        elif start == end:
            start, end = _____
        else:
            lst += [_____]

            start, end = _____, _____

    return _____
```

**4. (10 points) Walt is Relevant**

We have a list of numeric data points  $l$ , and we want to see if a list of relevant numbers  $s$  is found in the data. The catch is, we want to see if the numbers in  $s$  occur in the same order within the data of  $l$ , though not necessarily one after the other. If so, then  $s$  is a subsequence of  $l$ .

Write a predicate function `subseq` that takes two lists  $l$  and  $s$  as arguments, and determines if  $s$  is a subsequence of  $l$ . If so, the function should return `True`; otherwise, it should return `False`. We have provided a few doctests to demonstrate the definition and usage.

```
def subsequence(l, s):
    """
    Returns true if s is a subsequence of l.
    >>> subsequence([9, 1, 4, 5, 6], [4, 5, 6])
    True
    >>> subsequence([3, 5, 0, 3, 4, 3, 7, 9, 3, 2], [3, 3, 9, 2])
    True
    >>> # Below, the numbers in seq2 appear in seq1,
    >>> # but not in the same order.
    >>> subsequence([3, 5, 5, 8, 3], [8, 5, 3])
    False
    >>> # Below, not all the numbers in seq2 are present in seq1.
    >>> subsequence([3, 5, 5, 8, 3], [3, 2, 8])
    False
    >>> subsequence([3, 2, 57, 8], [3, 5, 7])
    False
    """
    if s == []:
        return _____

    elif l == []:
        return _____

    elif _____ == _____:
        return subsequence(_____, _____)

    else:
        return subsequence(_____, _____)
```

**5. (0 points) Games of Berkeley**

In the box below, write a positive integer. The student who writes the lowest unique integer will receive one extra credit point. In other words, write the smallest positive integer that you think no one else will write.
