CS 61A Spring 2015

Structure and Interpretation of Computer Programs

Midterm 1

INSTRUCTIONS

- You have 2 hours to complete the exam.
- The exam is closed book, closed notes, closed computer, closed calculator, except one hand-written $8.5" \times 11"$ crib sheet of your own creation and the official 61A midterm 1 study guide attached to the back of this exam.
- Mark your answers ON THE EXAM ITSELF. If you are not sure of your answer you may wish to provide a brief explanation.

Q. 1	Q. 2	Q. 3	Total
30		90. 3	
/4.0	1	1	
/12	/14	$/14$	/40

1. (12 points) In-N-Out

For each of the expressions in the tables below, write the output displayed by the interactive Python interpreter when the expression is evaluated. The output may have multiple lines. No errors occur.

The first two rows have been provided as examples of the behavior of the built-in pow and print functions.

Recall: The interactive interpreter displays the value of a successfully evaluated expression, unless it is None.

Assume that you have started Python 3 and executed the following statements:

Expression	Adder Wie Culput	responder	Interactive Output
pow(2, 3)	raa v ₈ eenat	powedaci	
print(4, 5)	4 5		
<pre>print(re(1+2), print(4))</pre>		car(1)(double)(pow)	
cheap(3)		<pre>double(print(1))</pre>	
cheap(seat(2))		car(0)(seat)(add)	

2. (14 points) Supernatural

(a) (6 pt) Fill in the environment diagram that results from executing the code below until the entire program is finished, an error occurs, or all frames are filled. You may not need to use all of the spaces or frames.

A complete answer will:

- Add all missing names and parent annotations to all local frames.
- Add all missing values created or referenced during execution.
- Show the return value for each local frame.

Remember: Do not add a new frame when calling a built-in function (such as abs).

batman, superman, ivy = 1, -2, -3	Global frame	batman	1	
<pre>batman, superman, ivy = 1, -2, -3 def nanana(batman):</pre>				
<pre>4 while batman(superman) > ivy:</pre>		superman -2	2	
<pre>def batman(joker): return ivy</pre>				
7 return -ivy		ivy -3	·3 ——	
8		joker		▶ func joker(superman) [parent=Global]
<pre>9 def joker(superman): 10 if superman(batman):</pre>		Joker		rane joker (Superman, [parent stobat]

3. (14 points) You Complete Me

def longest_increasing_suffix(n):

(a) (4 pt) Implement the longest_increasing_suffix function, which returns the longest suffix (end) of a positive integer that consists of strictly increasing digits.

```
"""Return the longest increasing suffix of a positive integer n.

>>> longest_increasing_suffix(63134)
134
>>> longest_increasing_suffix(233)
3
>>> longest_increasing_suffix(5689)
5689
>>> longest_increasing_suffix(568901) # 01 is the suffix, displayed as 1
1
"""

m, suffix, k = 10, 0, 1
while n:
```

Assignment-Project-Exam-Help n // 10, n % 10

```

```

else: Add WeChat powcoder

return suffix

(b) (3 pt) Add parentheses and single-digit integers in the blanks below so that the expression on the second line evaluates to 2015. You may only add parentheses and single-digit integers. You may leave some blanks empty.

```
lamb = lambda lamb: lambda: lamb + lamb

lamb(1000)____ + (lambda b, c: b____ * b___ - c___)(lamb(____), 1)_____
```

(c) (3 pt) Implement the combine function, which takes a non-negative integer n, a two-argument function f, and a number result. It applies f to the first digit of n and the result of combining the rest of the digits of n by repeatedly applying f (see the doctests). If n has no digits (because it is zero), combine returns result.

```
def combine(n, f, result):
    """Combine the digits in non-negative integer n using f.

>>> combine(3, mul, 2) # mul(3, 2)
6
>>> combine(43, mul, 2) # mul(4, mul(3, 2))
24
>>> combine(6502, add, 3) # add(6, add(5, add(0, add(2, 3)))
16
>>> combine(239, pow, 0) # pow(2, pow(3, pow(9, 0)))
8
"""
if n == 0:
```

return result

from operator import add, mul
