## CS 61A Spring 2019

# Structure and Interpretation of Computer Programs

MIDTERM 1

#### INSTRUCTIONS

- You have 55 minutes to complete the exam.
- The exam is closed book, closed notes, closed computer, closed calculator, except one hand-written 8.5" × 11" crib sheet of your own creation and the official CS 61A midterm 1 study guide.
- Mark your answers on the exam itself. We will not grade answers written on scratch paper.

#### **POLICIES & CLARIFICATIONS**

- If you need to use the restroom, bring your phone and exam to the front of the room.
- You may use built-in Python functions that do not require import, such as min, max, pow, len, and abs.
- You may not use example functions defined on your study guides unless a problem clearly states you can.
- For fill-in-the blank coding problems, we will only grade work written in the provided blanks. You may only write one Python statement per blank line, and it must be indented to the level that the blank is indented.
- Unless otherwise specified, you are allowed to reference functions defined in previous parts of the same question.

#### 1. (10 points, 15 minutes) What Would Python Display

For each of the expressions in the table below, write the output displayed by the interactive Python interpreter when the expression is evaluated. The output may have multiple lines. If an error occurs, write "Error", but include all output displayed before the error. If evaluation would run forever, write "Forever". To display a function value, write "Function". The first two rows have been provided as examples.

The interactive interpreter displays the value of a successfully evaluated expression, unless it is None.

Assume that you have first started python3 and executed the statements on the left.

### 2. (10 points, 15 minutes) Environment Diagram

Fill in the environment diagram that results from executing the code on the right until the entire program is finished, an error occurs, or all frames are filled. You may not need to use all of the spaces or frames. A complete answer will:

- Add all missing names and parent annotations to all local frames.
- Add all missing values created or referenced during execution.
- Show the return value for each local frame.

```
1
    def f(x):
 2
      f = 10
 3
      z = 100
 4
      x = g(x)(f)
 5
      def f(x):
         return x + y
 7
       return f
8
9
    def g(g):
10
      return lambda g: g + z
11
12
    z = 3
13
    f = f(5)
```

#### 3. (10 points, 25 minutes) Zip It

We would like to create a function make\_zipper that takes two functions f1(x) and f2(x) and a "zipper sequence", which is a number that contains a series of 1s and 2s. It returns a function that is the equivalent of f1(f2(f2(...f1(x)...))) in which the exact sequence of f1s and f2s is given by the digits of the sequence. As an example, if the sequence were 1211, that would mean return a function of x that is the equivalent to f1(f2(f1(f1(x)))). Neither recursion nor containers (lists, dictionaries, sets, etc) are allowed in your solution.

```
def make_zipper(f1, f2, sequence):
                 """ Return a function of f1 and f2 composed based on sequence.
                >>> def increment(x):
                                                    return x + 1
                >>> def square(x):
                                                    return x * x
                >>> do_nothing = make_zipper(increment, square, 0)
                >>> do_nothing(2)
                                                                                                                       # Don't call either f1 or f2, just return your input untouched
                >>> incincsq = make_zipper(increment, square, 112)
                                                                                                                       # increment(increment(square(2))), so 2 \rightarrow 4 \rightarrow 5 \rightarrow 6
                >>> incincsq(2)
                 >>> sqincsqinc = make_zipper(increment, square, 2121)
                \underset{100}{\overset{>>>}{\text{eqincsqinc}(2)}} \\ \underset{100}{\overset{\#}{\text{square}(increlent(2)))}} \\ \underset{100}{\overset{\#}{\text{square}(increlent(2)))}} \\ \underset{100}{\overset{\#}{\text{square}(increlent(2)))}} \\ \underset{100}{\overset{\#}{\text{equare}(increlent(2)))}} \\ \underset{100}{\overset{\#}{\text{equare}(increlent(2))}} \\ \underset{100}{\overset{\#}{\text{equare}(increlent(2)))}} \\ \underset{100}{\overset{\#}{\text{equare}(increlent(2))}} \\ \underset{100}{\overset{\#}{\text{equare}(increlent(2))
                 11 11 11
                                                                                                        https://powcoder.com
