### CS 61A Fall 2017

# Structure and Interpretation of Computer Programs

MIDTERM 2

#### INSTRUCTIONS

- You have 2 hours to complete the exam.
- The exam is closed book, closed notes, closed computer, closed calculator, except two hand-written  $8.5" \times 11"$  crib sheets of your own creation and the two official CS 61A midterm study guides.
- Mark your answers on the exam itself. We will not grade answers written on scratch paper.

#### POLICIES & CLARIFICATIONS

- If you need to use the restroom, bring your phone and exam to the front of the room.
- Before asking a question, read the announcements on the screen/board. We will not answer your question directly. If we decide to respond, we'll add our response to the screen/board so everyone can see the clarification.
- For fill-in-the blank coding problems, we will only grade work written in the provided blanks. You may only write one Python statement per blank line, and it must be indented to the level that the blank is indented.
- Unless otherwise specified, you are allowed to reference functions defined in previous parts of the same question.

def smell(self):

f1 = Flower()
f2 = Flower()

return self.name.kind

### 1. (12 points) By Any Other Name (At least one of these is out of Scope: WWPD, Objects)

For each of the expressions in the table below, write the output displayed by the interactive Python interpreter when the expression is evaluated. The output may have multiple lines. The interactive interpreter displays the repr string of the value of a successfully evaluated expression, unless it is None. If an error occurs, write "Error", but include all output displayed before the error. The first row has been provided as an example.

Assume that you have started python3 and executed the code shown on the left first, then you evaluate each expression on the right in order. Statements and expressions sent to the interpreter have a cumulative effect.

```
class Plant:
                                          Expression
                                                                        Interactive Output
   k = 1
                                           [2, 3]
                                                                        [2, 3]
   kind = "green"

### 2. (8 points) Buy Local (At least one of these is out of Scope: Environment Diagram, Lists, Nonlocal, Recursion)

Fill in the environment diagram that results from executing the code below until the entire program is finished, an error occurs, or all frames are filled. You may not need to use all of the spaces or frames.

A complete answer will:

- Add all missing names and parent annotations to frames.
- Add all missing values created or referenced during execution.
- Show the return value for each local frame.
- Use box-and-pointer notation for list values. You do not need to write index numbers or the word "list".

Important: The slash on line 11 means that the return expression continues on the next line.

3. (	10	points)	Pumpkin	Splice	Latte

(a)	(2 pt) (All are in Scope: Lists) Implement splice, which takes two lists a and b and a non-negative integer k that is less than or equal to the length of a. It returns the result of splicing b into a at k. That is, it returns a new list containing the first k elements of a, then all elements of b, then the remaining elements of a.
def	splice(a, b, k): """Return a list of the first k elements of a, then all of b, then the rest of a.
	>>> splice([2, 3, 4, 5], [6, 7], 2) [2, 3, 6, 7, 4, 5]
	return
(b)	(3 pt) (All are in Scope: Lists) Implement all_splice, which returns a list of all the non-negative integers k such that splicing list b into list a at k creates a list with the same contents as c. Assume that splice is implemented correctly.
def	<pre>all_splice(a, b, c): """Return a list of all k such that splicing b into a at position k gives c.</pre>
	>>> all_saignment, Project Exam Help >>> all_splice([1, 2, 1, 2], [1, 2], [1, 2, 1, 2]) [0, 2, 4] """
(c)	(5 pt) (All are in Score: Cliffed Ass Chaplement pline, Whittage (the link instances a and b and a non-negative integer k that is less than or equal to the length of a. It returns a Link instance containing the first k elements of a, then all elements of b, then the remaining elements of a. The Link class is defined on the midterm 2 study guide.  Important: You may not use len, in, for, list, slicing, element selection, addition, or list comprehensions.
def	<pre>splink(a, b, k): """Return a Link containing the first k elements of a, then all of b, then the rest of a.</pre>
	>>> splink(Link(2, Link(3, Link(4, Link(5)))), Link(6, Link(7)), 2) Link(2, Link(3, Link(6, Link(7, Link(4, Link(5))))))

(b) (2 pt) (All are in Scope: Growth) Circle the  $\Theta$  expression that describes the minimum number of comparisons (e.g., <, >, <=,==, or >= expressions) required to verify that two sorted lists of length n contain no values in common.

 $\Theta(1)$   $\Theta(\log n)$   $\Theta(n)$   $\Theta(n^2)$  None of these

(c) (5 pt) (All are in Scope: Tree Recursion, Lists) Implement ways, which takes two values start and end, a non-negative integer k, and a list of one-argument functions actions. It returns the number of ways of choosing functions  $f_1, f_2, ..., f_j$  from actions, such that  $f_1(f_2(...(f_j(start))))$  equals end and  $j \le k$ . The same action function can be chosen multiple times. If a sequence of actions reaches end, then no further actions can be applied (see the first example below).

## Add WeChat powcoder

Name:	

<b>5.</b> (	(9	points	) Autumn	Leaves

**Definition.** A pile (of leaves) for a tree t with no repeated leaf labels is a dictionary in which the label for each leaf of t is a key, and its value is the path from that leaf to the root. Each path from a node to the root is either an empty tuple, if the node is the root, or a two-element tuple containing the label of the node's parent and the rest of the path (i.e., the path to the root from the node's parent).

(a) (5 pt) (All are in Scope: Trees) Implement pile, which takes a tree constructed using the tree data abstraction. It returns a pile for that tree. You may use the tree, label, branches, and is\_leaf functions from the midterm 2 study guide.

```
def pile(t):
```

# Assignment Project Exam Help

for b in branches(u):

https://powcoder.com

# Add WeChat powcoder

return p

(b) (4 pt) (All are in Scope: Objects. Trees) Implement Path, a class whose constructor takes a tree t constructed by tree and a leaf\_label. Assume all leaf labels of t are unique. When a Path is printed, labels in the path from the root to the leaf of t with label leaf\_label are displayed, separated by dashes. Assume pile is implemented correctly.
