CS 61A Spring 2015

Structure and Interpretation of Computer Programs

MIDTERM 2 SOLUTIONS

INSTRUCTIONS

- You have 2 hours to complete the exam.
- The exam is closed book, closed notes, closed computer, closed calculator, except one hand-written $8.5" \times 11"$ crib sheet of your own creation and the official 61A midterm 1 study guide attached to the back of this exam.
- Mark your answers ON THE EXAM ITSELF. If you are not sure of your answer you may wish to provide a brief explanation.

Q. 1	Q. 2	Q. 3	Q. 4	Total	
/12	/12	/14	/12	/50	

1. (12 points) Mutater-tot

For each of the expressions in the table below, write the output displayed by the interactive Python interpreter when the expression is evaluated. The output may have multiple lines. Expressions are evaluated in order, and expressions may affect later expressions.

Whenever the interpreter would report an error, write ERROR. If execution would take forever, write FOREVER. Assume that you have started Python 3 and executed the following statements:

```
def ready(betty):
    print(len(betty))
    betty[0].append(betty)
    return betty[0:1]
def get_set(s):
    ready(s)
    return s.pop()
def go(on, up):
    if up:
        return go(on[0], up-1)
    else:
       return on
                 nment Project Exam Help
    Г1.
g = [[3, 4], [5], 6]
h = [g, g]
```

Expression f.pop() Add WeChat powcoder h[1].pop() g[g[1][0]-g[0][1]] [5] 2 len(ready(g)) 1 g[0][2][0][1] 4 2 3 ready(get_set(h))[0][0] 3 [len(go(h, k)) for k in range(3)] [1, 3, 4]

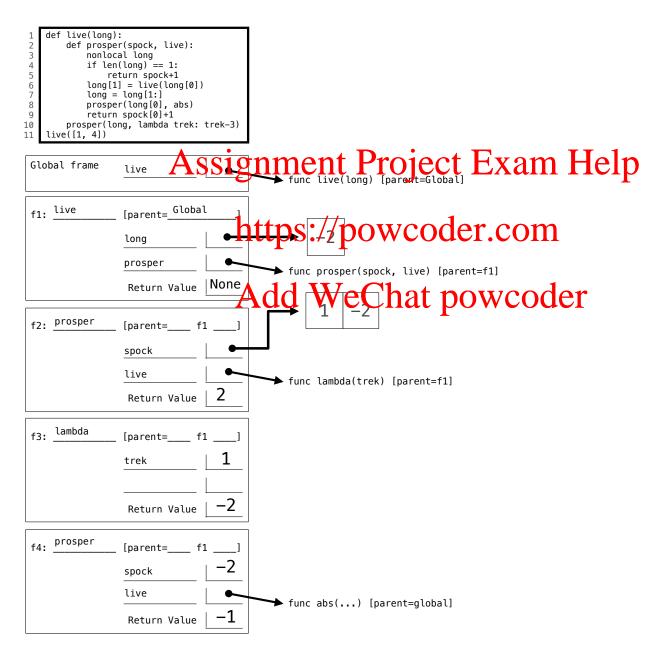

2. (12 points) Vulcans

(a) (8 pt) Fill in the environment diagram that results from executing the code below until the entire program is finished, an error occurs, or all frames are filled. You may not need to use all of the spaces or frames.

A complete answer will:

- Add all missing names and parent annotations to all local frames.
- Add all missing values created or referenced during execution.
- Show the return value for each local frame.

Remember: Do not add a new frame when calling a built-in function (such as abs). The built-in abs function is always written as func abs(...) [parent=Global].

(b) (4 pt) Fill in the environment diagram that results from executing the code below after the entire program is finished. No errors occur during the execution of this example.

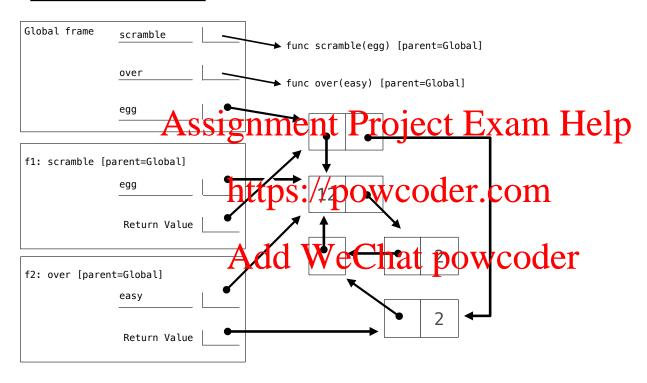

A complete answer will:

- Add all missing values created or referenced during execution.
- Show the return value for each local frame.

```
def scramble(egg):
    return [egg, over(egg)]

def over(easy):
    easy[1] = [[easy], 2]
    return list(easy[1])

egg = scramble([12, 24])
```

3. (14 points) Will Code for Points

(a) (2 pt) Implement objectify, which takes a tree data abstraction and returns an equivalent Tree instance. Both the Tree class and the tree data abstraction appear on the midterm 2 study guide.

Warning: Do not violate the tree data abstraction! (Exams are flammable.)

```
def objectify(t):
    """Return a Tree instance equivalent to a tree represented as a list.

>>> m = tree(2)
>>> m
[2]
>>> objectify(m)
Tree(2)
>>> r = tree(3, [tree(4, [tree(5), tree(6)]), tree(7, [tree(8)])])
>>> r
[3, [4, [5], [6]], [7, [8]]]
>>> objectify(r)
Tree(3, [Tree(4, [Tree(5), Tree(6)]), Tree(7, [Tree(8)])])
"""
return Tree(root(t), [objectify(b) for b in branches(t)])
```

(b) (2 pt) Circle SSI golds on the teriles flower of the ix and on the pealing objectify on a tree with n nodes.

```
\frac{\frac{\Theta(1)}{\text{https://powcoder.com}}}{\frac{\Theta(n^2)}{\text{powcoder.com}}}
```

(c) (4 pt) Implement closest, which takes a Tree of numbers t and returns the smallest absolute difference anywhere in the tree between an entry and the sum of the entries of its branches. The Tree class appears on the midterm 2 study guide. The built-in pin function takes a sequence and returns its minimum value. Reminder: A branches a limit of the tree t is now possible.

```
def closest(t):
    """Return the smallest difference between an entry and the sum of the
    root entries of its branches.

>>> t = Tree(8, [Tree(4), Tree(3)])
>>> closest(t) # |8 - (4 + 3)| = 1

1

>>> closest(Tree(5, [t])) # Same minimum as t

1

>>> closest(Tree(10, [Tree(2), t])) # |10 - (2 + 8)| = 0

0

>>> closest(Tree(3)) # |3 - 0| = 3

3

>>> closest(Tree(8, [Tree(3, [Tree(1, [Tree(5)])])))) # 3 - 1 = 2

>>> sum([])
0
"""
```

diff = abs(t.entry - sum([b.entry for b in t.branches]))

return min([diff] + [closest(b) for b in t.branches])

(d) (6 pt) Implement double_up, which mutates a linked list by inserting elements so that each element is adjacent to an equal element. The double_up function inserts as few elements as possible and returns the number of insertions. The Link class appears on the midterm 2 study guide.

```
def double_up(s):
    """Mutate s by inserting elements so that each element is next to an equal.
    >>> s = Link(3, Link(4))
    >>> double_up(s) # Inserts 3 and 4
    >>> s
    Link(3, Link(3, Link(4, Link(4))))
    >>> t = Link(3, Link(4, Link(4, Link(5))))
    >>> double_up(t) # Inserts 3 and 5
    2
    >>> t
    Link(3, Link(3, Link(4, Link(5, Link(5)))))
    \Rightarrow u = Link(3, Link(4, Link(3)))
    >>> double_up(u) # Inserts 3, 4, and 3
    >>> u
    \underset{if}{\overset{\text{Link}(3,\ \text{Link}(3,\ \text{Link}(4,\ \text{Link}(4,\ \text{Link}(3,\ \text{Link}(3))))))}}{\text{Exam Help}}
        return 0
    _{\tt elif s.res}h\underline{ttps:/\!/pyo}wcoder.com
        s.rest = Link(s.first)
        Add WeChat powcoder
    elif s.first == s.rest.first:
        return double_up(s.rest.rest)
    else:
        s.rest = Link(s.first, s.rest)
        return 1 + double_up(s.rest.rest)
```

Login:_______

4. (12 points) What color is it?

(a) (6 pt) Implement the look method of the Dress class. The look method returns a Dress instance's current color when the number of times that the instance's look method has ever been invoked evenly divides the total number times that the look method of any Dress instance has ever been invoked. Otherwise, the instance's color changes to the most recently returned color from any call to look, and None is returned.

```
class Dress:
   """What color is the dress?
   >>> blue = Dress('blue')
   >>> blue.look()
   'blue'
   >>> gold = Dress('gold')
   >>> gold.look()
   'gold'
   >>> blue.look() # 2 does not evenly divide 3; changes to gold
   >>> Dress('black').look()
   'black'
   >>> gold.look() # 2 does not evenly divide 5; changes to black
   >>> gold.look() # 3 evenly divides 6
   'black'
   ***Assignment Project Exam Help
   >>> gold.look() # 4 evenly divides 8
   'black'
   >>> blue.1https://powcoder.com
   'gold'
   11 11 11
   seen = 0
                dd WeChat powcoder
   color = Non
   def __init__(self, color):
       self.color = color
       self.seen = 0
   def look(self):
       Dress.seen += 1
       self.seen += 1
       if Dress.seen % self.seen == 0:
           Dress.color = self.color
           return self.color
       else:
           self.color = Dress.color
```

(b) (6 pt) Implement decrypt, which takes a string s and a dictionary d that contains words as values and their secret codes as keys. It returns a list of all possible ways in which s can be decoded by splitting it into secret codes and separating the corresponding words by spaces.

```
def decrypt(s, d):
   """List all possible decoded strings of s.
   >>> codes = {
          'alan': 'spooky',
          'al': 'drink',
         'antu': 'your',
          'turing': 'ghosts',
          'tur': 'scary',
          'ing': 'skeletons',
          'ring': 'ovaltine'
   ...}
   >>> decrypt('alanturing', codes)
   ['drink your ovaltine', 'spooky ghosts', 'spooky scary skeletons']
     Assignment Project Exam Help
       return []
   https://powcoder.com
   if s in d: Add WeChat powcoder
       messages.append(d[s])
   for k in range(1, len(s)+1):
       first, suffix = s[:k], s[k:]
       if first in d:
          for rest in decrypt(suffix, d):
              messages.append(d[first] + ' ' + rest)
   return messages
```
