### CS 61A Fall 2017

# Structure and Interpretation of Computer Programs

MIDTERM 1

#### **INSTRUCTIONS**

- You have 2 hours to complete the exam.
- $\bullet$  The exam is closed book, closed notes, closed computer, closed calculator, except one hand-written 8.5"  $\times$  11" crib sheet of your own creation and the official CS 61A midterm 1 study guide.
- ullet Mark your answers **on the exam itself**. We will *not* grade answers written on scratch paper.

#### 1. (10 points) I Wonder What Python Would Display (At least one of these is out of Scope: WWPD, HOFs, Lambdas)

For each of the expressions in the table below, write the output displayed by the interactive Python interpreter when the expression is evaluated. The output may have multiple lines. If an error occurs, write "Error", but include all output displayed before the error. To display a function value, write "Function". The first two rows have been provided as examples.

The interactive interpreter displays the value of a successfully evaluated expression, unless it is None.

Assume that you have first started python3 and executed the statements on the left.

	Expression	Interactive Output
	pow(2, 3)	8
<pre>aaron, burr = 2, 5 aaron, burr = 4, aaron + 1</pre>	print(4, 5) + 1	4 5 Error
	print(aaron, burr)	
hamil = 10		
<pre>def alex(hamil):     def g(w):     hamil = 2 * w</pre>

### 2. (8 points) Environmental Influences (At least one of these is out of Scope: Environment Diagrams, HOFs)

Fill in the environment diagram that results from executing the code below until the entire program is finished, an error occurs, or all frames are filled. You may not need to use all of the spaces, frames, or function values.

A complete answer will:

- Add all missing names and parent annotations to all local frames.
- Add all missing values created or referenced during execution.
- Show the return value for each local frame.

1		Global frame					
1 2	x = 1 def f(n):		1				
3	def f(n):  def g():		!		func f(n) [	ont-Clobell

#### 3. (3 points) Triangulate (All are in Scope: Control)

It's easy to see that in any triangle, each side must be shorter than the sum of the other two. Implement triangle, which takes three positive numbers, a, b, and c, and returns whether these three numbers could possibly be the lengths of the three sides of a triangle.

```
def triangle(a, b, c):
    """Return whether a, b, and c could be the legs of a triangle.

>>> triangle(3, 4, 5)
True
>>> triangle(3, 4, 6)
True
>>> triangle(6, 3, 4)
True
>>> triangle(6, 3, 4)
True
>>> triangle(3, 6, 4)
True
>>> triangle(9, 2, 2)
False
>>> triangle(2, 4, 2)
False
"""
```

4. (	9	points)	Digital

(a) (3 pt) (All are in Scope: Recursion) Implement collapse, which takes a non-negative integer, and returns the result of removing all digits from it that duplicate the digit immediately to their right.

```
def collapse(n):
```

"""For non-negative N, the result of removing all digits that are equal to the digit on their right, so that no adjacent digits are the same.

```
>>> collapse(1234)
1234
>>> collapse(12234441)
12341
>>> collapse(0)
0
>>> collapse(3)
3
>>> collapse(11200000013333)
12013
```

else:

return collapse(\_\_\_\_\_\_) \* 10 + \_\_\_\_\_

(b) (6 pt) (All are in Scope: Control, HOFs) Implement find\_pair, which takes a two-argument function, p, as input and returns another function. The returned function takes a non-negative integer n; it returns True if and only if p returns a true value when called on at least one pair of adjacent digits in n, and False otherwise. def find\_pair(p): """Given a two-argument function P, return a function that takes a non-negative integer and returns True if and only if two adjacent digits in that integer satisfy P (that is, cause P to return a true value). >>> z = find\_pair(lambda a, b: a == b) # Adjacent equal digits >>> z(1313) False >>> z(12334) True >>> z = find\_pair(lambda a, b: a > b) >>> z(1234) False >>> z(123412) >>> find\_pair(lambda a, b: a <= b)(9753) >>> fin Apsiring ment Project to Exampa Help https://powcoder.com def find(n): while ---- Add WeChat powcoder else:

5. (10 points) Please Confirm (All are in Scope: Recursion, HOFs)

**Definition.** A confirming function for a sequence of digits, called a code, takes a single digit as its only argument. If the digit does not match the first (left-most) digit of the code to be confirmed, it returns False. If the digit does match, then the confirming function returns True if the code has only one digit, or another confirming function for the rest of the code if there are more digits to confirm.

(a) (5 pt) Implement confirmer so that when confirmer takes a positive integer code, it returns a confirming function for the digits of that code.

```
def confirmer(code):
   """Return a confirming function for CODE.
   >>> confirmer(204)(2)(0)(4) # The digits of 204 are 2, then 0, then 4.
   >>> confirmer(204)(2)(0)(0) # The third digit of 204 is not 0.
   False
   >>> confirmer(204)(2)(1)
                           # The second digit of 204 is not 1.
   False
   >>> confirmer(204)(20)
                         # The first digit of 204 is not 20.
   False
   def confirm1(d, t):
             ssignment Project Exam Help
              return t
          else:
       return result ttps://powcoder.com
   def extend(prefix, rest):
       """Return a confirming substitute that returns REST when give the digits of PREFIX. For example, if the extend(12, confirmer(34)), then c(1) returns confirmer(34),
       so that c is a confirming function for 1234."""
       left, last = prefix // 10, prefix % 10
       if _____:
          return _____
       else:
```

(b) (5 pt) Given a confirming function, one can find the code it confirms, one digit at a time. Implement decode, which takes a confirming function **f** and returns the code that it confirms. def decode(f, y=0): """Return the code for a confirming function f. >>> decode(confirmer(12001)) 12001 >>> decode(confirmer(56789)) 56789 d = 0while d < 10: x, code = \_\_\_\_\_, \_\_\_\_\_, <sup>11</sup> Assignment Project Exam Help return code https://powcoder.com elif x == False: Add WeChat powcoder else:
